

Question 1:

Explain how you would onboard this client. Cover:

- **Key steps from kickoff to go-live**
- **What you would do in Week 1**
- **What success looks like after onboarding**

Answer :

Client onboarding is one of the most important stages of any project because it creates the first impression and lays the foundation for a successful long-term relationship. My goal would be to ensure that the client feels supported, understands the product, and is fully prepared before the kiosks go live across all 15 restaurant outlets.

I would begin the onboarding process with a kickoff meeting involving both the client and the implementation team. During this meeting, I would introduce the project members, understand the client's business requirements, discuss their expectations, confirm the implementation timeline, and define communication channels. I would also explain the project plan and ensure that everyone understands their roles and responsibilities.

After the kickoff meeting, I would gather all the necessary information required for implementation, such as menu details, payment methods, outlet information, internet availability, and any specific business requirements. Once everything is confirmed, I would coordinate the installation and configuration of the self-ordering kiosks, ensuring that the software, payment systems, printers, and other integrations are set up correctly.

Before launching the kiosks, I would conduct thorough testing to verify that every feature works as expected. This includes checking the ordering process, payment functionality, receipt generation, and overall system performance. Any issues identified during testing would be resolved before moving to the next stage.

Since the client is not very tech-savvy, I would conduct simple and interactive training sessions for the restaurant staff. I would demonstrate the complete ordering process, allow hands-on practice, answer their questions, and provide helpful resources such as user manuals, quick reference guides, FAQs, and support contact details. My aim would be to ensure that every staff member feels confident using the kiosks independently.

During the first week of the project, I would focus on completing the kickoff meeting, gathering business requirements, verifying hardware and software readiness, preparing the implementation schedule, and planning the staff training sessions. Building a strong foundation during the first week is essential for keeping the project on track and avoiding delays later.

Before deploying the solution across all 15 outlets, I would recommend a pilot launch in one or two locations. This allows us to identify and fix any technical or operational issues in a real environment before the full rollout. Once the pilot is successful, I would proceed with the

complete deployment while closely monitoring system performance and providing immediate support whenever required.

I would consider the onboarding successful if all outlets are operational within the planned timeline, the staff can confidently use the kiosks without assistance, customers are able to place orders smoothly, and the client is satisfied with the implementation and ongoing support. A successful onboarding process not only ensures a smooth launch but also builds trust and creates the foundation for a long-term partnership with the client.

Question 2:

The rollout must be completed in 30 days. Answer:

- **What are the main phases of this project?**
- **What risks do you foresee?**
- **How would you ensure timelines are met?**

Answer :

Successfully completing the rollout within 30 days requires proper planning, coordination, and continuous monitoring. As a Client Success Manager, my responsibility would be to ensure that every stage of the project is completed on time while maintaining good communication with both the client and the internal teams.

I would divide the project into five main phases. The first phase would be **planning and requirement gathering**, where I would conduct a kickoff meeting, understand the client's business requirements, confirm the rollout schedule, assign responsibilities, and finalize the implementation plan. The second phase would be **installation and configuration**, where the kiosks would be installed, the software would be configured, payment gateways would be integrated, and all required settings would be completed. The third phase would focus on **testing and staff training**. During this stage, I would ensure that every kiosk functions correctly and provide hands-on training so the restaurant staff can confidently operate the system. The fourth phase would be a **pilot rollout** in one or two outlets to identify and resolve any issues before expanding further. Finally, after a successful pilot, I would proceed with the **full rollout** across all 15 outlets while closely monitoring the implementation and providing immediate support whenever required.

While planning the rollout, I would also consider potential risks that could affect the project timeline. These may include hardware installation delays, internet connectivity issues, software bugs, payment gateway failures, delays in client approvals, or staff being unfamiliar with the new technology. Identifying these risks early allows the team to prepare backup plans and reduce their impact on the project.

To ensure the rollout is completed within the 30-day timeline, I would create a detailed project schedule with clear milestones and responsibilities for every team member. I would conduct

regular progress meetings, monitor daily tasks, and quickly address any issues that arise. Maintaining open communication with the client and internal teams would help avoid misunderstandings and keep everyone aligned. If any delays occur, I would immediately identify the cause, adjust the plan if necessary, and coordinate with the relevant teams to keep the project on track.

Overall, I believe that careful planning, proactive risk management, regular communication, and continuous monitoring are the key factors in delivering a successful rollout on time while ensuring a positive experience for the client.

Question 3:

The client staff is non-technical. Explain:

- . How would you conduct product demos and training?**
- . What materials would you prepare?**
- . How would you check if training was effective?**

Answer :

Since the client's staff is not very familiar with technology, I would make the training as simple and practical as possible. My main objective would be to help them feel comfortable using the self-ordering kiosks in their daily work without any confusion.

I would start by giving a short introduction to the kiosk and explaining how it benefits both the restaurant and its customers. Then, I would demonstrate the complete ordering process, from selecting menu items and customizing orders to making payments and completing a transaction. Instead of using technical terms, I would explain every step in simple language so that everyone could easily understand.

After the demonstration, I would encourage each staff member to use the kiosk themselves while I guided them through the process. Hands-on practice is the best way to build confidence, so I would allow enough time for everyone to try different scenarios and ask questions whenever they needed clarification. I would also explain how to handle common situations, such as restarting the kiosk, checking the internet connection, or contacting the support team if any issue occurs.

To make learning easier even after the training session, I would provide a user manual, a quick reference guide, short video tutorials, a list of frequently asked questions (FAQs), and a simple troubleshooting guide. These resources would help the staff quickly solve minor problems without waiting for technical support.

To evaluate whether the training was successful, I would ask each staff member to perform common tasks on their own, such as placing an order, processing a payment, and assisting a

customer. I would observe how confidently they completed these tasks and provide additional guidance wherever required. I would also collect their feedback and monitor the number of support requests during the first few days after deployment. If the staff can operate the kiosks independently and customers are able to place orders without any difficulties, I would consider the training effective and the onboarding process successful.

Question 4:

During live usage, 3 kiosks stop accepting orders during peak hours. Answer:

- . What would be your immediate response?**
- . How would you coordinate with the technical team?**
- . What would you communicate to the client?**

Answer :

If three kiosks suddenly stop accepting orders during peak hours, I understand that this can create a stressful situation for the client, especially when customer traffic is high. My immediate response would be to stay calm, act quickly, and focus on reducing the disruption as much as possible. I would first acknowledge the issue right away and reassure the client that I am taking ownership of the situation. At the same time, I would gather key details such as the outlet location, kiosk IDs, any error messages displayed, and when the issue started. This information is important so that the technical team can begin troubleshooting without delay.

Once I have the necessary details, I would immediately escalate the issue to the technical support team and clearly communicate that this is a high-priority incident due to its impact during peak hours. I would stay actively involved by maintaining constant communication with the technical team, sharing updates, and ensuring that the issue is being addressed as quickly as possible. If needed, I would also help facilitate communication between different teams to avoid any delays or confusion.

While the technical team is working on resolving the issue, I would also think about practical ways to support the client on the ground. For example, I might suggest temporarily redirecting customers to the remaining operational kiosks, encouraging staff to assist customers manually, or switching to an alternative ordering method if available. These small actions can help keep operations running and reduce customer frustration during the downtime.

Communication with the client is equally important during this time. I would keep them informed at every stage, not just when they ask for updates. I would apologize sincerely for the inconvenience, explain what steps are being taken, and provide realistic timelines whenever possible. Being transparent and proactive helps build trust, even in challenging situations.

Once the kiosks are back up and running, I would confirm with the client that everything is functioning properly and that operations have returned to normal. I would also check if there are any lingering concerns or additional support needed.

After the situation is fully resolved, I would work closely with the technical team to conduct a root cause analysis. Understanding what went wrong is essential to prevent similar issues in the future. I would then share a clear and simple explanation with the client, along with the corrective actions taken and any preventive measures implemented. This not only reassures the client but also demonstrates our commitment to continuous improvement and reliable service.

Question 5:

After 2 months:

- **Client is unhappy**
- **Churn risk is high**

Explain:

- **How would you identify the root cause?**
- **What steps would you take to rebuild trust?**
- **How would you reduce churn?**

Answer :

If I notice that kiosk usage is low after two months and the client is unhappy, I would treat it as a high-priority situation. Instead of making assumptions, I would first focus on understanding the actual reasons behind the problem. My goal would be to identify the root cause, address the client's concerns, and rebuild their confidence in our product and services.

To identify the root cause, I would begin by analyzing usage reports, customer feedback, and support tickets. I would also schedule a meeting with the client to understand their experience and listen carefully to their concerns. During the discussion, I would ask questions about the challenges they are facing, whether the staff are comfortable using the kiosks, if customers are finding the system easy to use, and whether any technical issues are affecting daily operations. This information would help me determine whether the problem is related to product usability, lack of training, technical issues, or operational challenges.

Once I clearly understand the problem, I would prepare a practical action plan and share it with the client. If additional staff training is needed, I would organize refresher sessions. If there are technical issues, I would work closely with the support and product teams to ensure they are resolved quickly. Throughout this process, I would maintain regular communication with the client, provide progress updates, and make sure they feel heard and supported.

To rebuild trust, I believe honesty, transparency, and consistent follow-up are essential. I would acknowledge the client's concerns, apologize for any inconvenience they experienced, and assure them that their feedback is valuable. Instead of making unrealistic promises, I would focus on delivering measurable improvements and keeping every commitment I make.

To reduce the risk of churn, I would schedule regular review meetings, monitor product adoption, track client satisfaction, and continue collecting feedback even after the issues are resolved. By maintaining a strong relationship, providing proactive support, and continuously improving the client's experience, I would aim to increase product adoption, restore their confidence, and build a long-term partnership.

Question 6:

You receive repeated feedback: "Order customization is confusing for customers."

Answer:

- **How would you document and validate this feedback?**
- **How would you communicate this to the Product team?**
- **What follow-up would you do with the client?**

Answer :

When I receive repeated feedback that customers find the order customization process confusing, I would consider it an important issue because it directly affects the customer experience and the client's satisfaction. Rather than relying on assumptions, I would first gather enough information to clearly understand the problem before taking any action.

To document the feedback, I would record the client's comments, note the specific customization options that customers find confusing, and collect supporting details such as screenshots, customer complaints, support tickets, or examples from the kiosks. I would also identify whether the issue is being reported by multiple outlets or only a few locations. This helps determine how widespread the problem is and whether it requires immediate attention.

To validate the feedback, I would review customer usage data, discuss the issue with restaurant staff, and, if possible, observe customers using the kiosks. This would help confirm whether the problem is caused by the user interface, unclear instructions, or a complex ordering process.

After validating the issue, I would prepare a clear report for the Product team. The report would include a description of the problem, supporting evidence, its impact on customer experience and business operations, and practical suggestions for improvement. I would work closely with the Product team to ensure they fully understand the client's concerns and prioritize the issue appropriately.

Finally, I would follow up with the client by informing them that their feedback has been shared with the Product team and is being reviewed. I would provide regular updates on the progress, communicate any planned improvements, and check with them after the changes are implemented to ensure the issue has been resolved. This continuous communication shows that we value their feedback and are committed to improving their experience.

Question 7:

What client success metrics would you track? List:

- **3 engagement or usage metrics**
- **2 satisfaction or relationship metrics**
- **How often would you report them**

Answer :

As a Client Success Manager, I believe tracking the right metrics is essential to understand how effectively the client is using the product and whether they are satisfied with the overall experience. These metrics help identify potential issues early, measure the success of the implementation, and support continuous improvement.

To measure product engagement and usage, I would first track the Kiosk Adoption Rate, which shows the percentage of total customer orders placed through the self-ordering kiosks. This helps determine whether customers are actively using the kiosks or still relying on traditional ordering methods.

The second metric would be the Number of Orders Processed Through the Kiosks. Monitoring this regularly helps identify usage trends, compare performance across different outlets, and evaluate whether kiosk usage is increasing over time.

The third metric would be the System Uptime and Issue Rate, which measures how reliably the kiosks are performing. Frequent technical issues or downtime can negatively affect both customer experience and client satisfaction, so monitoring this metric is very important.

To measure client satisfaction and build strong relationships, I would track the Customer Satisfaction Score (CSAT) by collecting feedback after onboarding, training sessions, or support interactions. I would also monitor the Net Promoter Score (NPS) to understand how likely the client is to recommend our product and services to others, which reflects their overall trust and satisfaction.

I would prepare weekly reports during the implementation and initial support phase to monitor progress and quickly resolve any issues. Once the project becomes stable, I would share monthly performance reports highlighting product usage, client feedback, key achievements, and areas for improvement. Regular reporting keeps both the client and internal teams informed, supports better decision-making, and helps build a strong, long-term partnership.

engagement. It also demonstrates a proactive attitude and commitment to continuously improving the customer experience.

Question 8:

You are asked to update a small FAQ page for clients. Answer briefly:

- . How HTML, CSS, and JavaScript help in such a task**
- . ONE example of how JavaScript can improve client experience**
- . Why basic SEO matters for support documentation**

Answer :

Updating a client FAQ page requires both good design and functionality to ensure that clients can easily find the information they need. HTML, CSS, and JavaScript each play an important role in creating a simple, user-friendly, and effective support page. In addition to these technologies, attention to usability, accessibility, and performance also contributes to a better overall experience for clients.

HTML (HyperText Markup Language) provides the basic structure of the FAQ page. It is used to organize the content by creating headings, questions, answers, lists, links, and other elements. A well-structured HTML page makes the information easy to read and navigate. Using proper semantic tags such as `<h1>`, `<h2>`, `<section>`, and `<article>` helps both users and search engines understand the content better. It also improves accessibility for users who rely on screen readers, ensuring that the FAQ page is inclusive and usable by a wider audience.

CSS (Cascading Style Sheets) is used to improve the appearance of the page. It controls the layout, colors, fonts, spacing, and overall design, making the FAQ page look clean, professional, and responsive across different devices such as desktops, tablets, and mobile phones. CSS can also be used to highlight important information, create visual hierarchy, and improve readability through proper spacing and contrast. Additionally, responsive design techniques ensure that the FAQ page adapts smoothly to different screen sizes, providing a consistent experience for all users.

JavaScript adds interactivity to the page and improves the overall user experience. For example, I would use JavaScript to create an expandable FAQ section where clients can click on a question to show or hide its answer. This keeps the page organized, reduces unnecessary scrolling, and helps users quickly find the information they are looking for. Another useful feature could be a search bar that allows users to type keywords and instantly filter relevant questions and answers. JavaScript can also be used to track user interactions, helping identify which questions are most frequently accessed and where improvements may be needed.

Basic **SEO (Search Engine Optimization)** is also important because it helps support documentation appear in search engine results when clients search for solutions online. Using clear page titles, relevant keywords, proper headings, and descriptive content makes the FAQ page easier to discover. Adding meta descriptions, optimizing images, and ensuring fast page loading speeds further improve search visibility. Good SEO practices not only increase traffic to the FAQ page but also reduce the number of support requests, as clients can quickly find

answers on their own. This ultimately improves efficiency for both the support team and the clients.

In summary, combining structured HTML, well-designed CSS, interactive JavaScript, and effective SEO practices results in a comprehensive FAQ page that is easy to use, visually appealing, and highly accessible.

Question 9:

You receive the following data for one outlet:

Metric	Value
Daily Orders	120
Orders via Kiosk	45
Failed Orders	5
Avg Order Value	₹320

Answer:

- **Kiosk adoption percentage**
- **Daily revenue from kiosks**
- **ONE insight you would share with the client**

Given Data:

- Total Daily Orders = **120**
- Orders via Kiosk = **45**
- Failed Orders = **5**
- Average Order Value = **₹320**

1. Kiosk Adoption Percentage

The kiosk adoption percentage shows how many customers are choosing to place their orders through the self-ordering kiosks.

Calculation:

Kiosk Adoption Percentage = (Orders via Kiosk ÷ Total Daily Orders) × 100

= (45 ÷ 120) × 100

= **37.5%**

Answer: 37.5%

2. Daily Revenue from Kiosks

Since 5 kiosk orders were unsuccessful, only the successful orders should be considered for revenue calculation.

Successful Kiosk Orders = 45 – 5 = 40

Calculation:

Daily Revenue = Successful Orders × Average Order Value

= 40 × ₹320

= ₹12,800

Answer: ₹12,800 per day

3. Insight

From the given data, I can see that only **37.5%** of the total orders are being placed through the self-ordering kiosks. This indicates that there is significant room to improve kiosk adoption. Additionally, the **5 failed orders** suggest that some customers may be facing technical or usability issues while placing their orders. By identifying and resolving the reasons behind these failed transactions and encouraging more customers to use the kiosks through better guidance or promotions, the restaurant can increase customer satisfaction, improve kiosk usage, and generate higher daily revenue.

Question 10:

A client says, “Your product is good, but your support is slow.” Answer:

- **How would you respond verbally in the moment?**
- **What internal steps would you take after the call?**
- **How would you prevent this feedback in future?**

If a client tells me, "Your product is good, but your support is slow," I would see it as valuable feedback and an opportunity to improve the client's experience. My first priority would be to listen carefully without interrupting and acknowledge their concern. I would respond politely by saying, "Thank you for sharing your honest feedback. I sincerely apologize for the delay in our support. I understand how frustrating this must have been, and I appreciate you bringing it to our attention. I will personally look into the issue and ensure that we work towards a faster resolution."

After the call, I would review the client's support history, including previous tickets, response times, and the actions taken by the support team. I would discuss the issue with the relevant teams to identify the reason for the delay, whether it was caused by communication gaps, resource limitations, or technical challenges. If necessary, I would escalate unresolved issues and work with the team to ensure they are resolved as quickly as possible.

To prevent similar feedback in the future, I would focus on improving our support process by setting clear response-time expectations, regularly monitoring support performance, and conducting periodic reviews of pending tickets. I would also maintain proactive communication with the client by providing regular updates instead of waiting for them to ask. In addition, I would schedule follow-up meetings to check their satisfaction and collect feedback after issues are resolved.

Overall, I believe that timely communication, taking ownership of client concerns, and continuously improving support processes are essential for building trust and maintaining long-term client relationships. By treating every piece of feedback as an opportunity to improve, I can help create a better experience for both the client and the organization.
